Subject: North Pole

Hi Brandon,

The PA states that there has been no sulfolane detected in the new city wells. However this recent water quality report from the city appears to contradict that statement. The language in the city's report is somewhat ambiguous but it appears to say that sulfolane is consistently detected in low levels (4-7ppb) in the raw water even from the new wells, but that their "treatment" removes the low levels before it reaches consumers' taps. Attached is a scanned copy of the page regarding sulfolane. Please let me know if you are certain no sulfolane has been detected in the new wells.

Thanks for all of your efforts on behalf of our environment.

Regards, Russ
